HOW THE POLL WAS CONDUCTED AND THE MARGIN OF ERROR CALCULATED

July 26, 2020

The CBS News survey is conducted by YouGov using a nationally representative sample of 2,008 U.S. adult residents interviewed online between July 21-24, 2020.

This sample was weighted according to gender, age, race, and education based on the American Community Survey, conducted by the U.S. Bureau of the Census, as well as 2016 Presidential vote and registration status. "Likely voters" – respondents' relative probabilities of voting – were determined using a model that takes into account self-reported likelihood of voting, along with other individual-level and aggregate factors. Respondents were selected from YouGov's opt-in panel to be representative of all U.S residents. The weights range from 0.1 to 5.5, with a mean of 1 and a standard deviation of 0.6.

The *margin of error* (a 95% confidence interval) for a sample percentage p based upon the entire sample is approximately 2.5% and approximately 3.1% when based upon the sample of likely voters. It is calculated using the formula

$$\hat{p} \pm 100 \times \sqrt{\frac{1 + \mathsf{CV}^2}{n}}$$

where CV is the coefficient of variation of the sample weights and n is the sample size used to compute the proportion. This is a measure of sampling error (the average of all estimates obtained using the same sample selection and weighting procedures repeatedly). The sample estimate should differ from its expected value by less than margin of error in 95 percent of all samples. It does not reflect non-sampling errors, including potential selection bias in panel participation or in response to a particular survey.
