HOW THE POLL WAS CONDUCTED AND THE MARGIN OF ERROR CALCULATED

March 25, 2018

The CBS News survey is conducted by YouGov using a nationally representative sample of 2,206 U.S. residents interviewed online between March 19-21, 2018.

The final sample included oversamples of 854 parents, as well as 433 adults aged 18-24, and 466 adults aged 25-29. This sample was weighted according to gender, age, race, education, and children under 18 at home based on the American Community Survey, conducted by the U.S. Bureau of the Census, as well as 2012 and 2016 Presidential vote. Respondents were selected from YouGov's opt-in panel to be representative of all U.S. residents. The weights range from 0.3 to 7.3, with a mean of 1 and a standard deviation of 1.16.

The *margin of error* (a 95% confidence interval) for a sample percentage p based upon the entire sample is approximately 3.2%. It is calculated using the formula

$$\hat{p} \pm 100 \times \sqrt{\frac{1 + CV^2}{n}}$$

where CV is the coefficient of variation of the sample weights and n is the sample size used to compute the proportion. This is a measure of sampling error (the average of all estimates obtained using the same sample selection and weighting procedures repeatedly). The sample estimate should differ from its expected value by less than margin of error in 95 percent of all samples. It does not reflect non-sampling errors, including potential selection bias in panel participation or in response to a particular survey.
