# HOW THE POLL WAS CONDUCTED AND THE MARGIN OF ERROR CALCULATED

October 14, 2018

The CBS News 2018 Battleground Tracker is a panel study based on interviews conducted of registered voters in 61 competitive and likely competitive congressional districts in the United States. The poll was conducted by YouGov, an online polling company.

This poll was fielded between October 9-12, 2018 with 4,831 respondents. The respondents were selected from YouGov's online panels to be representative of registered voters in these districts in terms of age, race, gender, and education. The sample was weighted according to gender, age, race, and education, based on the American Community Survey, conducted by the U.S. Bureau of the Census, as well as 2016 Presidential vote, and post-stratified on district type. The weights were trimmed to have a maximum value of 8, and range from 0.2 to 8.1, with a mean of 1 and a standard deviation of 0.8.

The set of competitive and likely competitive districts in this wave are: AR02, AZ01, AZ02, CA10, CA21, CA25, CA39, CA45, CA48, CA49, CO06, FL18, FL26, FL27, GA06, IA01, IA03, IL06, IL12, IL13, IL14, KS02, KS03, KY06, ME02, MI08, MI11, MN01, MN02, MN03, MN08, NC09, NC13, NE02, NH01, NJ02, NJ03, NJ07, NJ11, NM02, NV03, NY19, NY22, NY24, OH01, OH10, OH12, PA01, PA05, PA06, PA07, PA17, TX07, TX23, TX32, UT04, VA02, VA07, VA10, WA08, WV03.

The *margin of error* (a 95% confidence interval) for a sample percentage  $p$  based upon the entire sample is approximately 1.8%. It is calculated using the formula

$$\hat{p} \pm 100 \times \sqrt{\frac{1 + CV^2}{n}}$$

where CV is the coefficient of variation of the sample weights and  $n$  is the sample size used to compute the proportion. This is a measure of sampling error (the average of all estimates obtained using the same sample selection and weighting procedures repeatedly). The sample estimate should differ from its expected value by less than margin of error in 95 percent of all samples. It does not reflect non-sampling errors, including potential selection bias in panel participation or in response to a particular survey.

# HOUSE MODEL METHODOLOGY

October 14, 2018

The CBS News – YouGov House Model is based on interviews with 33,476 registered voters from October 1-11, 2018, including respondents from the CBS News Battleground Tracker as well as other YouGov surveys. While this is a large sample, we nonetheless use the model to produce more reliable estimates for the districts than would be achievable based on the amount of sample in each of them alone, and the model accounts for the uncertainty around each of those estimates. The House estimate's margin of error corresponds to a 95% confidence interval.

We use a technique called Multilevel Regression and Post-stratification (or MRP for short) to produce estimates for all 435 Congressional districts. The idea behind MRP is to use the polling data from the preceding seven days to estimate a model relating interview date, district, voter demographics, past voting behavior, and other respondent profile variables to their current voting intentions. This model is then used to estimate the probability that a voter with specified characteristics prefers the Democratic or Republican House candidate. Using data from the American Community Survey, the Current Population Survey, both produced by the US Census, and past election results, we estimated the number of each type of voter in each district. We also estimated a turnout model using data on past midterm elections. The product of estimated party preference rates, turnout rates, and census counts provides an estimate of the number of voters in each district intending to vote for a party on each day.

The models were simulated repeatedly to obtain a range of estimates and corresponding confidence intervals for each of the 435 seats and the total number of seats won by each party.
