Questions 47- 50: Respondents were recontacted after the indictment was announced. See methods box for details.

# HOW THE POLL WAS CONDUCTED AND THE MARGIN OF ERROR CALCULATED

The CBS News/YouGov survey of 2,480 adults in the U.S. was conducted between June 7-10, 2023.

This sample was weighted according to gender, age, race, and education based on the U.S. Census American Community Survey, and the U.S. Census Current Population Survey, as well as 2020 Presidential vote and 2022 Congressional vote. Respondents were selected to be representative of adults nationwide. The weights range from 0.04 to 6.0, with a mean of 1 and a standard deviation of 1.0.

1,798 respondents were recontacted to complete a follow-up survey after the federal indictment of Donald Trump was unsealed. A recontact weight is applied by age, gender, race, education, 2020 vote, party identification, and 2024 primary intent. The recontact weights range from 0.05 to 6.4, with a mean of 1 and a standard deviation of 1.0.

The *margin of error* (a 95% confidence interval) for a sample percentage  $p$  based upon the entire sample is approximately 2.7% and 3.3% for the recontacted sample. The *margin of error* is calculated using the formula

$$\hat{p} \pm 100 \times \sqrt{\frac{1 + CV^2}{n}}$$

where CV is the coefficient of variation of the sample weights and  $n$  is the sample size used to compute the proportion. This is a measure of sampling error (the average of all estimates obtained using the same sample selection and weighting procedures repeatedly). The sample estimate should differ from its expected value by less than margin of error in 95 percent of all samples. It does not reflect non-sampling errors, including potential selection bias in panel participation or in response to a particular survey.
