# HOW THE POLL WAS CONDUCTED AND THE MARGIN OF ERROR CALCULATED

The CBS News/YouGov survey of 1,133 registered voters in Georgia was conducted between March 4-11, 2024.

This sample was weighted according to gender, age, race, and education based on the U.S. Census American Community Survey, and the U.S. Census Current Population Survey, as well as 2020 Presidential vote. “Likely voters” – respondents’ relative probabilities of voting – were determined using a regression model that incorporates current, self-reported intentions to vote, along with individual-level and aggregate data about voters, such as demographics and vote history. Respondents were selected to be representative of registered voters in Georgia. The weights range from 0.1 to 10.1, with a mean of 1 and a standard deviation of 0.9.

The *margin of error* (a 95% confidence interval) for a sample percentage  $p$  based upon the entire sample is approximately  $\pm 3.9$  points.. It is calculated using the formula

$$\hat{p} \pm 100 \times \sqrt{\frac{1 + CV^2}{n}}$$

where CV is the coefficient of variation of the sample weights and  $n$  is the sample size used to compute the proportion. This is a measure of sampling error (the average of all estimates obtained using the same sample selection and weighting procedures repeatedly). The sample estimate should differ from its expected value by less than margin of error in 95 percent of all samples. It does not reflect non-sampling errors, including potential selection bias in panel participation or in response to a particular survey.
